

(A) The DeSurv model

NMF: learns gene programs (W) and sample loadings (H)

α controls balance

Cox model: links gene programs to survival

Cox Model on factor scores

$$Z = (X^T W) \cdot \beta$$

$$\beta (k \times 1)$$

$\alpha = 0$: standard NMF
(unsupervised)

W
is shared between
NMF & Cox

$\alpha \rightarrow 1$: gene-level Cox
model

(B) Data-driven model selection via Bayesian optimization

Bayesian Optimization
